

Post Course – React Project

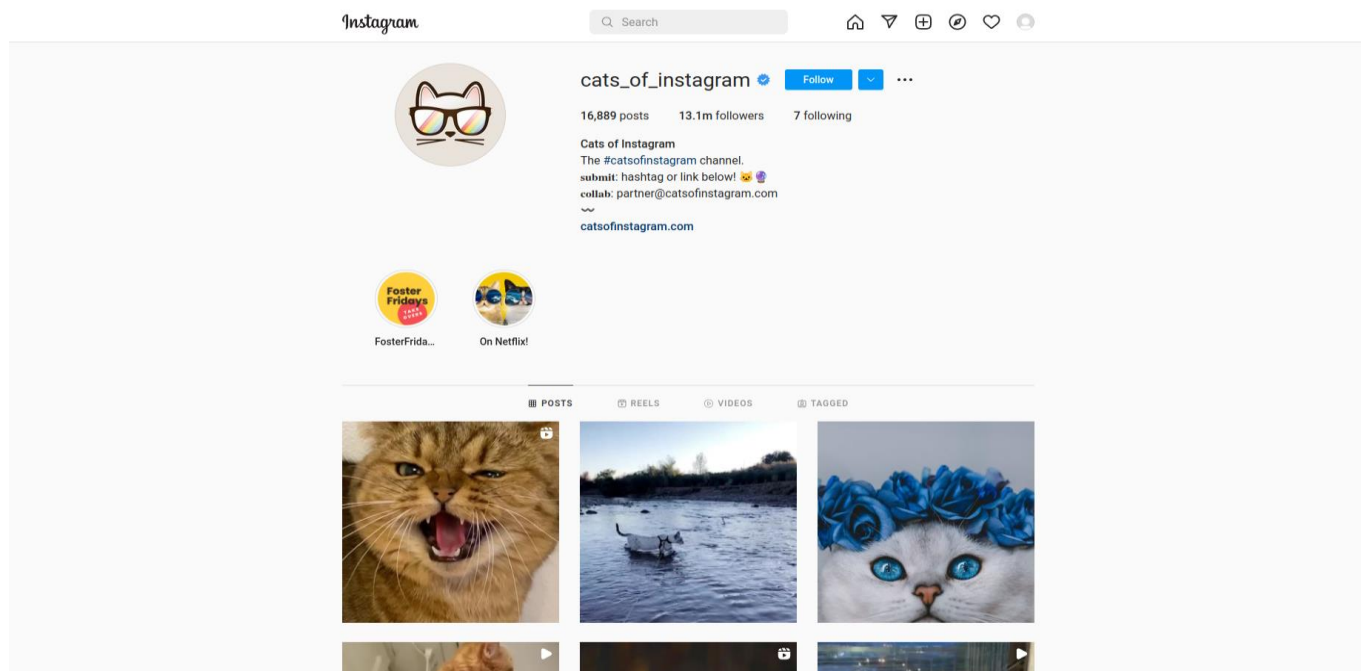

Overview

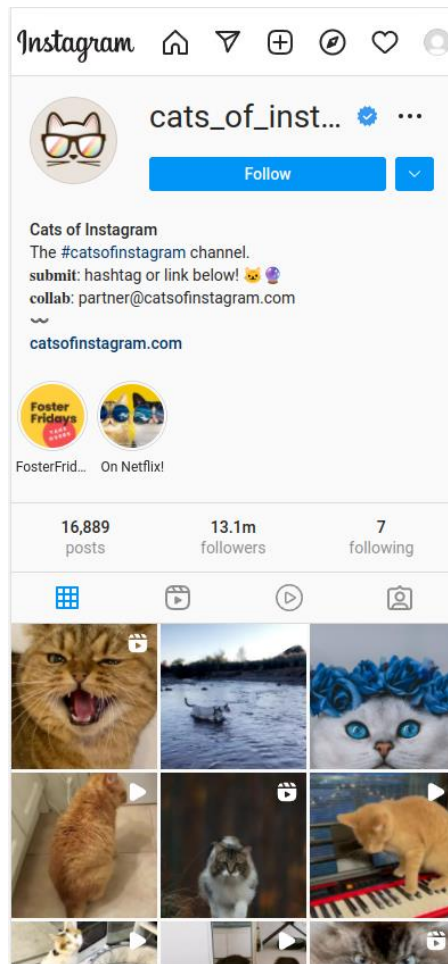

It's time to consolidate everything you've learned about React during the course. We're going to build a clone of Instagram's profile page.

Goals

1. **A functioning Instagram profile page:** The main task is to create a clone of an Instagram profile page – example provided below – in order to consolidate what you know about components, state, props etc.
2. **Practice using Git and GitHub flow:** It's important that we continue to use GitHub best practices. This means making regular commits, making use of branching etc.

Specifications

Make the following additions to your project:

- You need to have it as a repository on GitHub
- You can use React Router and have multiple profiles accessible using /nameOfPerson
- Your data for profiles should be stored in a data file, the structure of this data is up to you
- You are encouraged to use B.E.M as a naming convention & SCSS for styling.

4

- We would like you to take a Mobile first approach to the implementation. Your finished project should be viewable on Mobile, Tablet and Desktop
- Your images should be displayed by mapping over data and should not be hardcoded
- You can take this project as far as you like, feel free to get creative
